

How much fuel are you giving away and how much can you afford to lose?

**Why
give away
thousands
of dollars**

**at your
pumps
each year?**

Meter calibration must be as near to zero as possible. You shouldn't wait for the Weights and Measures Sealer to come out to your location to check the accuracy of your meters. If

Weights and Measures finds a meter out of tolerance they will tag it out of service causing downtime and as a result, lost revenue. Have United Pump Supply test them. Your meters may only need a field adjustment by a qualified Service Technician. Inaccurate meters can cause thousands of dollars in lost profits each year, even when your meters are within the nationally accepted tolerance. Worn meters invariably over

delivery. The wear allows the fuel to pass through, without being metered. A meter that is off by 6 cubic inches (the allowed tolerance in most states) gives away almost 260 gallons per 50,000 gallons dispensed. And that means you're pumping away profits!

No matter what type of meter you have, we have the parts and technical knowledge to correct your meter problems, and help your business be more profitable.

Calculate Your Actual Give Away:

Fill in the blanks and calculate how much you are giving away at the pump.

(gallons sold per month) X .8658 gallon/per thousand = _____
(gallons pumped away at 1 cu. in. per 5 gal.) _____

(gallons given away) X (cost per gallon) = (\$given away each month)

- **Double** your give away if your meters are over delivering 2 cubic inches.
- **Triple** your give away if your meters are over delivering 3 cubic inches.
